

Detection of c.1640T>C mutation in RYR1 gene causing malignant hyperthermia after exposure to a chemical trigger in different dog breeds

Customer: MVDr. Ivana Stodůlková, Poříčí 18, 67801 Blansko, Czech Republic

Sample:

Sample: 21-13017

Date received: 11.05.2021

Sample type: blood

Owner: Monika Pelíšková, Rozstání 251,
789 62 Rozstání

Information provided by the customer

Name: Grissly (Gloriandus Faberge)

Breed: Dalmatian

Tattoo number: GLS124

Microchip: 643 099 100 013 664

Date of birth: 18.09.2018

Sex: female

Date of sampling: 07.05.2021

The identity of the animal has been checked by MVDr. Ivana Stodůlková, KVL 5437

Result: Mutation was not detected (N/N)

Explanation

Presence or absence of c.1640T>C mutation in RYR1 gene causing malignant hyperthermia (MH), which develops after exposure to a chemical trigger, was tested. MH is a severe complication during the general anaesthesia that can be even fatal. MH is a pharmacogenetic disease of skeletal muscles characterized by hypercapnia, tachycardia and hyperthermia, which occur in response to some chemical drugs, in this case anaesthetics. The affected dogs have no clinical symptoms unless they are exposed to these drugs inducing this condition.

Mutation that causes MH is inherited as an autosomal dominant trait. Only one copy of the mutated gene is sufficient for development of clinical signs (result N/P (negative / positive) or P/P (positive / positive)). With regard to the fact that affected animals are without clinical signs, provided they are not exposed to the trigger substance, some animals can live their whole lives without diagnosing the disposition for MH. In case of affected animal the risk of transfer to the offsprings is 50%.

Method: SOP172-MH, direct DNA sequencing

Date of issue: 21.05.2021

Date of testing: 11.05.2021 - 21.05.2021
